

Data vs. Information

In today's society, companies wouldn't be able to function if they did not have databases for their services. They serve as a place where all data regarding their business, clients, and services are stored and managed properly. A database such as Oracle has many components that allow its clients to have all types of data stored into the server. These components can consist of the users, administrators, services, and personal information along with many others that may exist.

All these components are joined together to have an organized way of seeing how the business runs overall. Without all this data, the business would not be able to keep track of all the tables of information of their clients. Each table serves a purpose in providing valuable information that is linked to many other tables.
